

1. I will consider to use for my final project React and Node . I will consider to front end UI for my project while considering about doing the full stack application. This application is going to be website that helps individuals choose Food recipes or choices. The goal will your project be designed to achieve better understanding of how applications are ran and the fundamentals of setting applications on websites. It would also helped me know the set up for different applications and approaches to designing websites. The kind of users that I will target is mainly individuals who love food or want to get ideas for food recipe. It can be from teenagers to older adults because we all have to learn how to make things and how it should put together. I am considering using the data that is within the API to consist in my application. I am hoping that it runs through my application system. I also planning on using this API data to structure how I would like my application to be ran. The different issues that I may encounter is hoping to being hoping the application is not too big and being lost within the application. It may come into looking into the database that the API would run correctly in the application. Some other issues I might come across is hoping my Terminal runs with my application because some of our computers might crash and have to restart an application and ends up losing all of your project. I also hope that my application will not begin to start being messy. There should not be any sensitive information because it should able to be available for the public to interact with. It is not anything that should not be sensitive information to people or to this application. The functionality that my application would include is personalization and being able to go in out of different segments of the application. Different paths of processing through the API, this would actually something I would need to include in the future.
